Supplementary Table 8. Association of the THB composite with 3-month poor outcome under three weighting schemes

Weighting scheme	Spearman ρ vs. original	Adjusted OR per SD (95% CI)	AUC
Equal weight (original THB)	1.000	1.19 (1.11–1.27)	0.828
PCA first component	0.999	1.20 (1.12–1.28)	0.828
Data-driven weights	0.987	1.21 (1.13–1.30)	0.828

All models adjust for the same clinical covariates. Odds ratios are per 1 SD of each (standardized) composite. Spearman ρ is computed against the original equally weighted THB.
THB, total hemorrhagic burden; OR, odds ratio; SD, standard deviation; AUC, area under the receiver operating characteristic curve; PCA, principal-component analysis.
